1763

-- The MAILING DATE of this communication appears on the cover sheet with the correspondence address --
Period for Reply

A SHORTENED STATUTORY PERIOD FOR REPLY IS SET TO EXPIRE 3 MONTH(S) FROM THE MAILING DATE OF THIS COMMUNICATION.

- Extensions of time may be available under the provisions of 37 CFR 1.136 (a). In no event, however, may a reply be timely filed after SIX (6) MONTHS from the mailing date of this communication.
- If the period for reply specified above is less than thirty (30) days, a reply within the statutory minimum of thirty (30) days will be considered timely.
- If NO period for reply is specified above, the maximum statutory period will apply and will expire SIX (6) MONTHS from the mailing date of this communication.
- Failure to reply within the set or extended period for reply will, by statute, cause the application to become ABANDONED (35 U.S.C. § 133).

Status

- 1) ☒ Responsive to communication(s) filed on 28 March 2000.
- 2a) ☐ This action is **FINAL**. 2b) ☒ This action is non-final.
- 3) ☐ Since this application is in condition for allowance except for formal matters, prosecution as to the merits is closed in accordance with the practice under *Ex parte Quayle*, 1935 C.D. 11, 453 O.G. 213.

Disposition of Claims

- 4) ☒ Claim(s) 1-34 is/are pending in the application.
- 4a) Of the above claim(s) _____ is/are withdrawn from consideration.
- 5) ☐ Claim(s) _____ is/are allowed.
- 6) ☐ Claim(s) 1-34 is/are rejected.
- 7) ☐ Claim(s) _____ is/are objected to.
- 8) ☐ Claims _____ are subject to restriction and/or election requirement.

Application Papers

- 9) ☐ The specification is objected to by the Examiner.
- 10) ☐ The drawing(s) filed on _____ is/are objected to by the Examiner.
- 11) ☐ The proposed drawing correction filed on _____ is: a) ☐ approved b) ☐ disapproved.
- 12) ☐ The oath or declaration is objected to by the Examiner.

Priority under 35 U.S.C. § 119

- 13) ☐ Acknowledgment is made of a claim for foreign priority under 35 U.S.C. § 119(a)-(d).
- a) ☐ All b) ☐ Some * c) ☐ None of the CERTIFIED copies of the priority documents have been:
1. ☐ received.
2. ☐ received in Application No. (Series Code / Serial Number) _____.
3. ☐ received in this National Stage application from the International Bureau (PCT Rule 17.2(a)).
- * See the attached detailed Office action for a list of the certified copies not received.
- 14) ☐ Acknowledgement is made of a claim for domestic priority under 35 U.S.C. & 119(e).

Attachment(s)

- 14) ☒ Notice of References Cited (PTO-892)
- 15) ☐ Notice of Draftsperson's Patent Drawing Review (PTO-948)
- 16) ☐ Information Disclosure Statement(s) (PTO-1449) Paper No(s) _____
- 17) ☐ Interview Summary (PTO-413) Paper No(s). _____
- 18) ☐ Notice of Informal Patent Application (PTO-152)
- 19) ☐ Other: _____

Art Unit: 1763

DETAILED ACTION

Response to Arguments

1. Applicant's arguments with respect to claims 1-34 have been considered but are moot in view of the new ground(s) of rejection. Furthermore, the Examiner argues that even though Shan, et al. uses a liner for controlling the DC bias on the cathode electrode, the liner is capable of being used as a floating electrode by simply isolating the (optionally conductive) liner from the grounded chamber wall.

Claim Rejections - 35 USC § 103

1. The following is a quotation of 35 U.S.C. 103(a) which forms the basis for all obviousness rejections set forth in this Office action:

(a) A patent may not be obtained though the invention is not identically disclosed or described as set forth in section 102 of this title, if the differences between the subject matter sought to be patented and the prior art are such that the subject matter as a whole would have been obvious at the time the invention was made to a person having ordinary skill in the art to which said subject matter pertains. Patentability shall not be negated by the manner in which the invention was made.

2. This application currently names joint inventors. In considering patentability of the claims under 35 U.S.C. 103(a), the examiner presumes that the subject matter of the various claims was commonly owned at the time any inventions covered therein were made absent any evidence to the contrary. Applicant is advised of the obligation under 37 CFR 1.56 to point out the inventor and invention dates of each claim that was not commonly owned at the time a later invention was made in order for the examiner to

Art Unit: 1763

consider the applicability of 35 U.S.C. 103(c) and potential 35 U.S.C. 102(f) or (g) prior art under 35 U.S.C. 103(a).

3. Claims 1, 2, 4, 6, 9, 13, 14-34 are rejected under 35 U.S.C. 103(a) as being unpatentable over the Prior Art admitted by the present Applicants (pages 7-8 and Fig. 2) in view of Shan, et al. (US Patent No. 5,605,637) and Walko, II (US Patent 6,051,100).

The admitted Prior Art by the present Applicants disclosed on pages 7-8 and Fig. 2 teaches all limitations of the claimed apparatus comprising a reactor 100, a chamber wall 102, top electrode 104 coupled to an RF power 106 and includes a plurality of gas distribution holes 105, a top shroud 108 surrounding the top electrode 104, a bottom electrode 110 coupled to an RF power 112 and also includes an electrostatic chuck that secures a substrate 114, a focus ring 116 surrounding the bottom electrode 110 and is made of ceramic material such as aluminum oxide, a silicon ring 118 surrounding the edge of the substrate 114, a teflon shroud (liner) 120, and a confinement ring 122 that is made of an insulating material and is floating.

The disclosed admitted Prior Art fails to teach a liner made of a material that is resistant to etching and electrically floating during plasma processing, and a plasma confinement which is located around and below the surface of the workpiece and is made of electrically conductive material.

Shan, et al. teach a chamber liner 44 installed over a portion of the interior wall of the reactor chamber to reduce the effective area of the first (top) electrode and thus

Art Unit: 1763

reduces the dc bias on the second (bottom) electrode (column 2, lines 55-63). Further control of the dc bias is provided by changing the materials used for the chamber liner 44. Although preferably a dielectric material, the chamber liner may also be a semiconductor material, or even a conductor such as anodized aluminum. (column 5, lines 32-36). A plasma shield 30, made of a dielectric material (column 2, lines 43-54), is connected to the chamber wall which is grounded.

Walko, II also teaches a high conductance plasma containment structure (Figs. 1-10) 40 that is electrically grounded. The containment structure 20 contains openings 42 to permit process gases to flow from an inlet 21, through a manifold 23, through the containment structure 40 and out pumping port 19. (column 8, line 23 through column 9, line 46). Figs. 2-10 show detail structure of some of the embodiments of the containment plate 40 (column 9, line 63 through column 11, line 10) .

The containment structure may also include a plurality of containment plates 140 containing openings 142 to progressively attenuate the plasma and electric field in the chamber (column 9, lines 58-62).

It would have been obvious to one of ordinary skill in the art at the time the invention was made to use the liner as taught by Shan, et al. and the grounded plasma containment as taught by Walko, II in the apparatus shown in Fig. 2 of the admitted prior art instead of the teflon liner 120 and plasma confinement ring 122 in order to confine the plasma while permitting the plasma gases exit the chamber.

Art Unit: 1763

Furthermore, even though Shan, et al. uses a liner for controlling the DC bias on the cathode electrode, the liner is capable of being used as a floating electrode by simply isolating the (optionally conductive) liner from the grounded chamber wall.

It would have been obvious to one of ordinary skill in the art at the time the invention was made to modify the shape, size, depth, and the percentage of the holes in the containment plate in order to optimize and improve the performance of the plasma containment.

4. Claims 3, 8 are rejected under 35 U.S.C. 103(a) as being unpatentable over the Prior Art admitted by the present Applicants (pages 7-8 and Fig. 2) in view of Shan, et al. (US Patent No. 5,605,637) and Walko, II (US Patent 6,051,100).

The admitted prior art, disclosed on pages 7-8, and Fig. 2 in combination with the teaching of Shan, et al. and Walko, II meet all limitations of the claims as discussed above since Fig. 2 of the prior art includes a mechanism for adjusting the distance 132 between the top and bottom electrodes. A screw linear actuator moves the top electrode 104 up and down and change the distance between the electrodes to an optimized value which may be any value including 0.5-2 inches.

5. Claims 5 and 7 are rejected under 35 U.S.C. 103(a) as being unpatentable over the Prior Art admitted by the present Applicants (pages 7-8 and Fig. 2) in view of Shan, et al. (US Patent No. 5,605,637) and Walko, II (US Patent 6,051,100) as applied to claims 1, 2, 4, 6, 9, 13, 14-34 above, and further in view of Tomoyasu, et al. (US Patent No. 5,900,103).

Art Unit: 1763

The admitted Prior Art disclosed by the Applicants, Shan, et al., and Walko, II teach all limitations of the claims as discussed above except for the explicit value of the RF applied to the electrodes.

Tomoyasu, et al. disclose a plasma reactor including a showerhead (top) electrode 21 and a bottom electrode 5 (Fig. 1). A high frequency of 10 MHz or more is applied to the top electrode and a lower frequency of 5 MHz or lower to the bottom electrode (column 2, lines 3-34). In one embodiment, a frequency of 27 MHz is applied to the top electrode (column 5, line 37-40).

Selection of the optimized radio frequency values for the electrodes from the teaching of Tomoyasu, et al. would have been obvious to one of ordinary skill in the art at the time of invention.

6. Claims 10-12 are rejected under 35 U.S.C. 103(a) as being unpatentable over the Prior Art admitted by the present Applicants (pages 7-8 and Fig. 2) in view of Shan, et al. (US Patent No. 5,605,637) and Walko, II (US Patent 6,051,100).

The admitted Prior Art disclosed on pages 7-8 and Fig. 2 in combination with Shan, et al. and Walko, II teach all limitations of the claims as discussed above except for the explicit ratio of the diameter of the chamber liner to plasma shield ring.

The ratio of the diameter of the chamber liner and the plasma shield ring does not appear to be critical and is considered to be a design choice that would have been obvious to one of ordinary skill in the art at the time of invention.

Art Unit: 1763

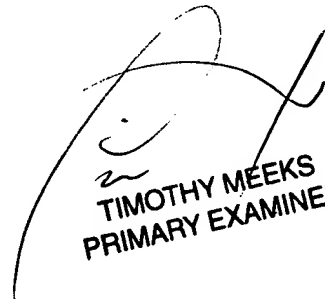

7. Any inquiry concerning this communication or earlier communications from the examiner should be directed to Parviz Hassanzadeh whose telephone number is (703)308-2050. The examiner can normally be reached on Tuesday-Friday.

If attempts to reach the examiner by telephone are unsuccessful, the examiner's supervisor, Shrive Beck can be reached on (703)308-2333. The fax phone numbers for the organization where this application or proceeding is assigned are (703)305-5408 for regular communications and (703)305-3599 for After Final communications.

Any inquiry of a general nature or relating to the status of this application or proceeding should be directed to the receptionist whose telephone number is (703)308-0661.

P.L.
